570. Managers with at Least 5 Direct Reports

Medium | Topics | Companies | Hint

SQL Schema > Pandas Schema >

Table: `Employee`

```
+-------------+---------+
| Column Name | Type    |
+-------------+---------+
| id          | int     |
| name        | varchar |
| department  | varchar |
| managerId   | int     |
+-------------+---------+
id is the primary key (column with unique values) for this table.
Each row of this table indicates the name of an employee, their department, and the id of their manager.
If managerId is null, then the employee does not have a manager.
No employee will be the manager of themself.
```

Write a solution to find managers with at least **five direct reports**.

Return the result table in **any order**.

The result format is in the following example.

Example 1:

> **Input:**
> Employee table:
>
> | id | name | department | managerId |
> |---|---|---|---|
> | 101 | John | A | null |
> | 102 | Dan | A | 101 |
> | 103 | James | A | 101 |
> | 104 | Amy | A | 101 |
> | 105 | Anne | A | 101 |
> | 106 | Ron | B | 101 |
>
> **Output:**
>
> | name |
> |---|
> | John |

Day-11, | 570 - managers with at least 5 direct Reports

we are given an employee table containing 4 columns:-

column	meaning
id	unique employee ID
name	Employee's name
department	department
managerId	ID of their manager.

Our task is to find the names of managers who have at least 5 direct reports.

In simple,
- every employee may have a manager
- managerId tells us who manages the employee
- we need to count how many employees report directly to each manager
- if the count is 5 or more, return that manager's name.

* we need direct reports, not employees working indirectly under a manager.

Example →

__/__/__

Input

id	name	department	managerId
101	John	A	NULL
102	Dan	A	101
103	James	A	101
104	Amy	A	101
105	Anne	A	101
106	Ron	B	101

John, ID = 101 (manager)

Dan James Amy Anne Ron.

total direct reports = 5.

John qualifies. ✓

(count the no. of employees in each manager's group)

Approach 1 :-

```
SELECT managerId, COUNT(*) AS
total_reports
FROM Employee
WHERE managerId IS NOT NULL
GROUP BY managerId;
```

but employees without a manager should not be counted → this groups all employees having the same manager ID.

result :-

managerId	total_report
101	5

~~Approach 2~~ :-
```
SELECT managerId
FROM Employee
WHERE managerId IS NOT NULL
GROUP BY managerId
HAVING COUNT(*) >= 5;
```

o/p
managerId
101.

but the que asks for the manager's name, not their ID, so we need to connect the manager ID with the employee table.

Approach 2 → we want to retrieve the manager's name.
```
SELECT m.name
FROM Employee e
JOIN Employee m
ON e.managerId = m.id
GROUP BY m.id, m.name
HAVING COUNT(e.id) >= 5;
```
e = employee reporting to someone
m = manager receiving the report.
↑ connects each employee with their manager. ← we group the records manager-wise. ↓ why m.id/m.name bcz we want to group by each individual manager & retrieve their name. including both also works with SQL modes that requires non-aggregated selected columns to appear in GROUP BY.

dry run

self join: match employee with their managers using managerId = id, Dan → John, Jane → John, Amy → John, Anne → John, Ron → John
↓
GROUP BY, John → 5 employees.
↓
5 → HAVING, 5 >= 5 → True.
↓
John
(manager with atleast 5 direct reports.

Code | MySQL

```mysql
# Write your MySQL query statement below
SELECT m.name
FROM Employee e
JOIN Employee m
ON e.managerId=m.id
GROUP BY m.id, m.name
HAVING COUNT(e.id) >= 5;
```

More challenges

```mysql
# Write your MySQL query statement below
SELECT m.name
FROM Employee e
JOIN Employee m
ON e.managerId=m.id
GROUP BY m.id, m.name
HAVING COUNT(e.id) >= 5;
```

Case 1

Input

Employee =

id	name	department	managerId
101	John	A	null
102	Dan	A	101
103	James	A	101
104	Amy	A	101
105	Anne	A	101
106	Ron	B	101

Output

name
John

Expected

name
John
